

WHAT IS CLAIMED IS:

1. An attachment apparatus for a container, comprising:
 - 5 a guide member having at least two guide rails, said guide rails each having a slotted track, said slotted track having a height adjustment slot and at least one arm slot extending from the height adjustment slot; and
 - a connector member operatively connected to said guide rails
 - 10 and moveable in said slotted track.
2. An apparatus according to claim 1, wherein the connector member extends through the slotted track in each guide rail present, and wherein with respect to a longitudinal direction, the
15 guide rails are substantially parallel or each disposed at an angle of about 1° to about 45° with respect to vertical with upper ends of the guide rails being closer together than lower ends of the guide rails.
- 20 3. An apparatus according to claim 2, wherein each guide rail has a thickness of from about 0.25 to about 3 inches.
4. An apparatus according to claim 2, wherein the track has about 1 to about 12 arm slots, and wherein at least one arm slot
25 terminates at an end portion which is located a distance of about 2 to about 12 inches from a rear edge of the guide rail.
5. An apparatus according to claim 4, wherein each guide rail has a front edge which is spaced an average distance of about 4 to
30 about 36 inches with respect to at least one other guide rail, and wherein about 1 to about 8 arm slots are present.

6. An apparatus according to claim 5, wherein the rail thickness is about 0.3 to about 2 inches, and wherein the rails are connected to a back plate.

5

7. An apparatus according to claim 6, wherein the guide rails are substantially parallel to each other and the slotted track has a comb configuration.

10

8. An apparatus according to claim 1, wherein a front wall of a container is connected to the guide member of the apparatus.

15

9. An apparatus according to claim 6, wherein a front wall of a container is connected to the guide member of the apparatus.

10. A transportable container having a height adjustable attachment apparatus, comprising:

20

a container body comprising a base and a front, upright section attached to said base;

a guide member having at least two guide rails, said guide member attached to said container front section; and

a connector member operatively connected to and moveable in a slotted track in each of said guide rails.

25

11. A container according to claim 10, wherein said slotted track has a height adjustment slot and at least one arm slot extending from the height adjustment slot.

30

12. A container according to claim 11, wherein the connector member extends through the slotted track in each guide rail

present, and wherein with respect to a longitudinal direction, the guide rails are substantially parallel or each disposed at an angle of about 1° to about 45° with respect to vertical with upper ends of the guide rails being closer together than lower ends of the guide rails.

13. A container according to claim 12, wherein the slotted track has about 1 to about 12 arm slots, and wherein each guide rail has a thickness of from about 0.25 to about 3 inches.

14. A container according to claim 13, wherein the guide rails are substantially parallel to each other, and wherein the guide rails are connected to a back plate with the back plate connected to the container upright section.

15. A container adjustable attachment apparatus, comprising:
a guide member having at least two side members capable of being attached to a container;

optionally a back plate capable of being attached to a container and said side members being attached to said back plate;

each said side member having a slotted track therein having at least a substantially vertical adjustment slot and at least two arm slots extending in a substantially horizontal direction;

each said side member slotted track having a said vertical adjustment slot and said horizontal slots in substantial alignment with the remaining slotted tracks; and

a connector member located within said slotted track of at least two said side members and being slidably movable therein,

said connector member being capable of receiving an attachment element for moving said guide member.

16. An apparatus according to claim 15, wherein the connector member extends through the slotted track in each side member present, wherein with respect to a longitudinal direction, the side members are substantially parallel or each disposed at an angle of about 1° to about 45° with respect to vertical with upper ends of the side members being closer together than lower end of the side members, and wherein the track has about 1 to about 12 substantially horizontal slots and wherein at least one horizontal slot terminates at an end portion which is located a distance of about 2 to about 12 inches from a rear edge of the side member.

17. An apparatus according to claim 16, wherein said back plate is present, and wherein the angle between said back plate and each rail is about 60° to about 120°.

18. An apparatus according to claim 17, wherein about 1 to about 8 horizontal slots are present and wherein the side members are substantially parallel to each other.

19. An apparatus according to claim 18, wherein the slotted track has a comb configuration.

20. An apparatus according to claim 19, wherein said guide member back plate is connected to a container comprising a front wall and a base.

30
